

The Donation Bet bias replicates on Qwen3.5-27B

Giraffe-spot Fermi estimate, temperature 1, n = 30 / 40 / 40. Swapping which side of the threshold funds the good cause shifts the whole estimate distribution with it. Pooled over both framings the bias is +0.42 with the CI excluding 0; the below-good direction alone does not reach significance at n=40 (CI 0.48-0.78). Hollow = outside the [T/10, 10T] window; one above-good rollout hit the 16k cap unfinished.

A. Each rollout's final estimate

B. Both point estimates sit above the null
